

Partners in Progress presents

The first course in Piglet Management and Farm Profitability

Successful pig production depends to a large extent on delivering high-quality piglets at weaning. How can you reduce mortality and improve performance in large litters right after farrowing?

Specific nutritional and management strategies must be implemented to have a more efficient colostrum supply and increased pre-weaning survivability. And we know that a good start reflects throughout the entire pig's life!

Become a **High-Quality Piglet Expert** by joining the **First Piglet Management and Farm Profitability Course offered by EW Nutrition**. This course brings together globally recognized experts in pig production to review key tools for increasing the productivity of your operation.

SAVE THE DATES!

17th DECEMBER

Chantal Farmer / Managing sows for optimal colostrum yield and piglet survival

14th JANUARY

Océane Schmitt / Effective management of large litters to reduce pre-weaning mortality
Rafa Pedrazuela / Globigen Pig Doser – Latest field results

25th FEBRUARY

Mike Tokach / Feeding the suckling-weaned piglet
Fellipe Barbosa / Globigen Jump Start – IgY for a healthy start

24th MARCH

Francesc Molist / The role of the gastrointestinal microbiome and application to the industry

Chantal Farmer

Research Scientist on Sow Lactation Biology, Agriculture and Agri-Food Canada, Sherbrooke, Québec

The inaugural course will be led by Chantal Farmer. Dr. Farmer's research goal is to understand factors that will impact milk and colostrum production in sows. She will discuss the essential role of colostrum and how factors such as hormones, nutrition, and the environment can affect colostrum yield and piglet survival.

Océane Schmitt

Research Associate, University of Bristol

Newborn piglets further need special nutritional and management strategies to support the hard time after birth. In order to help you to minimize after birth challenge and maximize the economic potential behind hyperprolific sows, Océane Schmitt will review crucial nutritional and management interventions during the first days after the piglets are born.

Mike Tokach

Distinguished Professor / Extension Specialist, Kansas State University

More and more data reinforces that it is mandatory to consider piglet feed management already in the lactation unit. Creep feeding is a management practice that presents opportunities for improving weaning weights and post-weaning pig performance. And who better to lead this topic than global expert Mike Tokach?

Francesc Molist

Manager, Research & Development, Schothorst Feed Research

Last but not least, we will take a deep look into the future, questioning how the early modulation of the microbiome will affect the later performance of our pigs. Francesc Molist will guide us through the journey of understanding the role of the gastrointestinal microbiome and its application to the industry.

The EWN team cordially invite you to this course. Join us to become a **High-Quality Piglet Expert!** You will have the opportunity to ask questions and receive insightful, actionable answers that will improve your toolkit and ultimately increase your operation's profitability. The individual invitations and links to each course will be shared with you every month.

The course takes place under the banner of *Partners in Progress – Connect*. This science-based series enables the exchange of experiences, knowledge, and innovative ideas around cutting-edge topics.
